## **ABSTRACT**

Study the issue is to evaluate, design and parking station travelers Tripoli International Airport, which is the largest airport in Libya at the moment and due importance to being the largest area of an airport in Libya, where Tripoli, capital of Libya, and the population density is equivalent to 2 million people. The objectives of this study are to evaluate the parking terminal and propose a solution. This chapter III discusses the methodology used in this research. The methodology in this research includes research preparation and literature review, data collection, analysis of the data and conclusion, as shown in the following flow chart, the description of each step is presented in subsequent sections. Parking passenger station to the airport in Tripoli existing need to develop and increase the capacity for the number of vehicles from the current capacity is increasing the capacity of the situation through the use of new additional space will be extended space to the north and re-planning position at an angle of 90 now under implementation side parts and which represent new passenger terminals.

Parking-based scheme angle of 90° The reason for the lack of sufficient capacity for the car park to reach the number of accumulation vehicles next position to the maximum value and that traverse the full capacity of the situation and thus can be attributed the rise in the number of cars as a result of passenger flow, which causes suffocation in the parking lot and not the ability to carrying excess number of cars that under the circumstances this time there are not enough positions for the operation of vehicles coming to him than we had re-design of this case . After previous conclusions and see the results of data analysis, where it was a peak hour start from (9 am to 10 am) which is cause of the congestion in Tripoli international airport parking and irregular parking system, found insufficient of parking capacity during this period which need to solve this problem so recommend to re-design Parking Tripoli International Airport to provide all facilities necessary needed of parking and must make special parking for public transport also places allocated for people with special needs and need to increase the capacity of terminal parking meet the needs of the delegates to the airport as well as taking into account the new terminals, which is under construction now.

Further increase the parking capacity, in anticipation of the increasing number of vehicles to be parked in the future. This change will increase the number of parking spaces for more vehicles than the current parking demand.

Data were collected vehicular traffic during the 12-hour part of the requirements analysis of these data required using formulas analysis contained in Chapter II of the analysis that we have gained as a result of the position is sufficient number of cars coming to him, which requires a preplanning of the car park at the corner of about 90° to provide a number more places the situation and also spaces periods less and thus can be attributed the rise in the number of cars as a result of passenger flow, which causes suffocation in the parking lot and not the ability to carry a number of vehicles in excess of that in the circumstances this time there are situations is not enough to run vehicles expatriate than we redesign this case.

## **CHAPTER I**

### **INTRODUCTION**

#### **1.1 Background**

Tripoli International Airport is the largest airport in Libya saluting located in the city of Tripoli (the town of Bin Ghashir) within 34 kilometers (21 miles) to the south from the center of the city of Tripoli. Extends from the airport to the estimated value of the total area of 12148194 square meters, and this space include all of the current airport terminal is currently serving international and domestic flights. Absorptive capacity of up to 3 million passengers per year. And dealing with passenger airport 2100000 in 2007, and one million passengers more than 3 in 2008 Within the past few years to build two new terminals on the total area allocated to the airport and all the new plants, with an area of 162,000 square meters (1.74 million square feet) in size, which will become the overall capacity of the airport to 20 million people.

**Figure 1-1 Terminal Building**

Hall of the old terminal is a five-storey building area of 33,000 square meters (360.00 square feet), and the airport is operated within 24 hours a day. But there are plans to build an airport hotel for transit passenger service. The new project aims to build two

new terminals at the airport ( East and West Terminal) on both sides of the existing international terminal, see Figure 1-2 illustrates this .

**Figure 1-2 Tripoli International Airport Area**

Where it was laying the foundation stone for the project in December 2007 and start construction work on the spot of a new east and west terminal in 2008 and until the beginning of 2011 has stopped working suddenly, it was not completed the construction because of Libya war and so far have not resumed work on new the project .We note that the schedule of a new project is 5 years for the implementation . Parking of old terminal current is the basis for the study of the proposed problem is capacity of terminal parking , it is not enough for parking a number of cars coming to its and we can put the details of this problem is due to lack of places allocated for people with special needs and also there is not a station for taxis and buses and there is some of reasons including this problem as is improper planning of the parking and Figure shows and some taxis parking in front of terminal building despite a traffic signal, which does not allow parking in front of the terminal building.

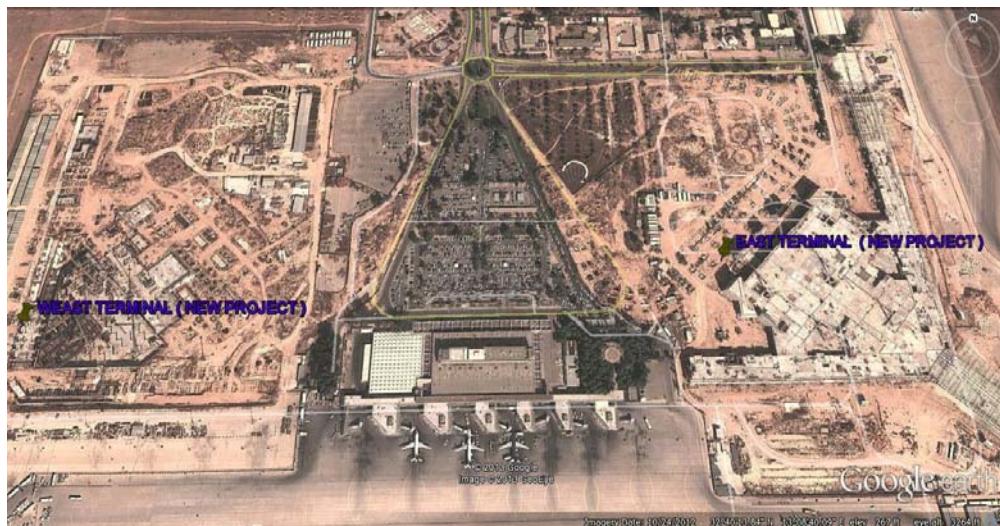

**Figure 1- 3 Taxi Stands Front Of Terminal**

Planning for parking at a 90-degree angle, accommodate 400 cars and circulation is complicated inside parking as overcrowding as cars cross main gate when it enter or exit of one gate .

## **1.2 Problem Statement**

Tripoli International Airport is the main airport in the Libyan capital Tripoli, where is the southern gate of the continent European. As mentioned previous in other words, Libya is the heart of the African continent and that due to its geographical location where the longest coastline extending north Africa for this reason it must develop and redesign the airport style modern prevailing in the world so that it can increase the capacity of the airport to 20 million passengers per year which is currently still under construction.

**Figure 1-4 New Terminal Under Construction**

The basic problem in question is to re-develop and design the car park as well as the allocation of sufficient space to create a station public transport including buses and taxis. Where the existing car park has several problems which are summarized in the following:

1. insufficient parking as a result of bad planning of the area that not to follow the specifications and see figure 1-5 there are many cars in front terminal building as crowded and traffic signal not allowance to parking there .

**Figure 1-5 Cars in front terminal building**

2. non-allocation within the station yard private airport for bus and taxi.
3. Non-provision of transport of people with special needs.

4. There is no automatic control, which enables to conduct the regulatory process for the passage of cars smoothly and regularity.
5. Considered also from one existing problems is position of passenger terminal parking as the lack of organizational management of vehicular traffic and follow the behavior of motorists in the car park where the behavior of some people is one of the reasons this problem and is the lack of parked the vehicle in places allocated sense the vehicle at out of planning for the car park, which is also what it means not to follow people and obedience to follow-up the laws within the car park , which requires structural re-organization of vehicular traffic within the administration position and having to follow all laws and regulations.

**Figure 1-6 The main Gate of Tripoli International Airport**

### 1.3 Objectives

The objectives of this study are to evaluate the parking terminal and propose a solution.

### 1.4 Scope Of The Study

The proposed research topic is a redesign of parking in Tripoli International Airport, which can be described as follows: -

1. Tripoli International Airport is located South of the capital Tripoli, about 34 km away.
2. Parking terminal is located in the front of the airport building and is bounded by faced along the New Tripoli Airport project.

3. The method used to analyze data vehicular traffic in this study is descriptive statistics based on parking theory.

## **1.5 Organization Of Thesis**

To facilitate easy and comprehensive, reading the results of this study will need to organize as follows:

### **A. CHAPTER I (Introduction)**

It contains a description of the background research, the research aims and objectives, constraints and systematic problems of writing.

### **B. CHAPTER II (literature review)**

It contains a description of the basics of theories related to the parking theories and its characteristics, statistical methods, and previous similar studies have ever done.

### **C. CHAPTER III (Research Methodology)**

It contains a description of the mindset of research, stages and procedures of research and analytical methods used.

### **D. CHAPTER IV (Data Analysis and Discussion)**

This section contains a description of the data results of research is accompanied by analysis and discussion of the nature and trends of the results of the study.

### **E. CHAPTER V (Conclusions and Recommendations)**

This section contains the conclusions that can be drawn from the results of analysis . It is also presented suggestions for the application of the possibility of further study

## CHAPTER II

### LITERATURE REVIEW

#### **2.1 Parking**

Parking is one of the major problems that is created by the increasing road traffic. It is an impact of transport development. The availability of less space in urban areas has increased the demand for parking space especially in areas like Central business district. This affects the mode choice also. This has a great economical impact.

**Figure 2 – 1 Shows Parking Exemplary**

#### **2.2 Definitions Transportation System .**

Transportation system is an interaction that occurs between the three inter-related components of the system and affect, the activity, transportation networks, and current (flow). For example, the current transport from one region to another occurs due to activity (economic, social, political, etc.). Mean while, the onset of flow due to infrastructure and means of transport between both regions.

### **2.3 Transportation and Land Use Relationships .**

Because land use is a representation of the type of human activity, it can be said that the inter-land use relationships that will always happen is a form of connection between human activities with each other. In an attempt to meet the need for their activities, humans must move from one land to another land . Shifting that is referred to as the trip (trip). If you travel a certain path using modes and then the trip is called traffic. Historically, land has always recognized a close relationship with transport. Changes in land use always leads to changes in the transportation system and vice versa. Connectedness between the two components are often referred to as the cycle of land use and transportation (land use-transportation cycle) .

### **2.4 Parking Studies .**

Before taking any measures for the betterment of conditions, data regarding availability of parking space, extent of its usage and parking demand is essential. It is also required to estimate the parking fares also. Parking surveys are intended to provide all these information. Since the duration of parking varies with different vehicles, several statistics are used to access the parking need.

- a.** Parking statistics Parking accumulation: It is needed as the number of vehicles parked at a given instant of time. Normally this is expressed by accumulation curve. Accumulation curve is the graph obtained by plotting the number of bays occupied with respect to time.

- b.** Parking volume: Parking volume is the total number of vehicles parked at a given duration of time. This does not account for repetition of vehicles.

- c.** Parking load :

Parking load gives the area under the accumulation curve. It can also be obtained by simply multiplying the number of vehicles occupying the parking area at each time interval with the time interval. It is expressed as vehicle hours.

- d.** Average parking duration: It is the ratio of total vehicle hours to the number of vehicles parked.

- e.** Parking turnover: It is the ratio of number of vehicles parked in a duration to the number of parking bays available. This can be expressed as number of vehicles per bay per time duration.

- f. Parking index: Parking index is also called occupancy or efficiency. It is needed as the ratio of number of bays occupied in a time duration to the total space available. It gives an aggregate measure of how effectively the parking space is utilized. Parking index can be found out as follows

$$\text{parking index} = \frac{\text{parking load}}{\text{parking capacity}} = 100 \dots \dots \dots (2-1)$$

## 2.5 Parking Surveys .

Parking surveys are conducted to collect the above said parking statistics. The most common parking surveys conducted are in-out survey, fixed period sampling and license plate method of survey.

1. In-out survey: In this survey, the occupancy count in the selected parking lot is taken at the beginning. Then the number of vehicles that enter the parking lot for a particular time interval is counted. The number of vehicles that leave the parking lot is also taken. The final occupancy in the parking lot is also taken. Here the labor required is very less. Only one person may be enough. But we wont get any data regarding the time duration for which a particular vehicle used that parking lot. Parking duration and turn over is not obtained. Hence we cannot estimate the parking fare from this survey.
2. Fixed period sampling: This is almost similar to in-out survey. All vehicles are counted at the beginning of the survey. Then after a fixed time interval that may vary between 15 minutes to 1 hour, the count is again taken. Here there are chances of missing the number of vehicles that were parked for a short duration.
3. License plate method of survey: This results in the most accurate and realistic data. In this case of survey, every parking stall is monitored at a continuous interval of 15 minutes or so and the license plate number is noted down. This will give the data regarding the duration for which a particular vehicle was using the parking bay. This will help in calculating the fare because fare is estimated based on the duration for which the vehicle was parked. If the time interval is shorter, then there are less chances of missing short-term parkers. But this method is very labor intensive.

## **2.6 Parking Maximum .**

In order to control the amount of land area allocated to parking, a number of cities have established parking maximums. Parking maximums are structured similarly to parking minimums, except that they define the maximum number of parking spaces on per unit basis that a development can provide. Developers may provide fewer parking spaces than the maximum allowed. In San Francisco, California, parking minimums exist for a number of the city's zoning districts, but maximum parking requirements are enforced in the downtown residential district (DTR). The minimum requirements of other areas serve as the maximum amount of street parking that may be provided in the DTR district.

## **2.7 Method of Determining the Provision of Parking Spaces .**

To determine the number of parking spaces can be used several methods as follows :-

### **2.7.1 The Method Focuses on the Number of Trips by Car .**

This method is applied in United States, with a coefficient of parking spaces (P), which is searched in the proportion of trips by private vehicle to the total trip vehicles. The amount of the trip is considered very closely related to the number of residents in the region. Magnitude of the coefficient of parking spaces can be formulated as follows .

$$p = \frac{drsc}{oc} \quad \dots \dots \dots \quad (2-2)$$

in which :

p = coefficient of parking spaces

d = comparison trip traffic seen at the center city of the hours 7:00 to 19:00 (taken 0.7).

o = occupancy vehicle (1.5 people / vehicle)

e = efficiency of the use of parking spaces (taken 0.85)

r = percentage of vehicles parked at the top of the volume daily (taken 0.25 for a small town and 0.4 for urban large)

s = peak factor for a moment (take 1.0)

c = factor that reflects the location of parking needs in the core of the central region

The advantages of this method is that it can determine unknown coefficients for the required parking spaces by looking at the way traffic on downtown and includes a peak hour factor. But the shortcomings of this method is the movement in the city that were

reviewed did not specifically show, as there is movement of commuters and other traffic movements e.g. trade, and also it is too broad if it will review an area.

### **2.7.2 The Method Focuses on the Capacity Road-Related Activity Center :-**

The number of parking spaces ( $p$ ) can be expressed as follows:

### **description :**

$p$  = The parking demand

c = The Capacity of road

**k** = The rate of non pass through capacity

The advantages of this method is that it can be determined the need for parking spaces based on the capacity of existing roads, while the downside is if the current through the small streets, the design of existing parking facilities is inefficient or wasteful.

### **2.7.3 The Method Focuses on the Number of Vehicle Ownership .**

In this method, it appears that the higher the number of resident, the smaller the percentage of parking spaces. This method is incompatible with the previous method. The method shows that the larger the population, the higher the percentage of required parking spaces.

The advantage of this method is that it can be show number of vehicles parked on the data of vehicle plate number of the city. But, the shortcoming of this method is if the area under review having visitors or user of the parking lot comes not from the city. In addition, this method is not suitably applied in Indonesia because Indonesia has a large population with higher vehicle ownership.

#### 2.7.4 Method of Volume Cordon Studies with a Maximum Accumulation .

Cordon is an imaginary boundary in the field of study. It is intended to determine the boundaries of a Central Business District (CBD) area. Studies in cordon volume will use the data of traffic flow on the entire CBD area. To know the maximum accumulation in the cordon, the number of parking space demand can be obtained by the formula as follows.

Where :

$p$  = the number of demand for parking spaces

$A_{i-1}$  = accumulated in the previous period (vehicle)

*Li* = the arrival of vehicles during the period i

$O_i$  = departure of vehicles in the period  $i$

The number of vehicles parking on the cordon can be determined by subtracting the maximum accumulated amount of the number of vehicles with the moving ones within the cordon , as given by the following formula :

$$PV = A - MV \dots\dots\dots(2-5)$$

In which :

PV = estimate of parked cars (vehicles)

A = the maximum accumulation (vehicle)

MV = estimate of a moving car

Meanwhile, the number of moving cars (MV) is estimated by doing a survey. The survey is conducted the traffic on the sections around the area study. The advantage of this method is the flexibility in determining the cordon in study area. As a result, this method can determine which area that has similar land use characteristics. This method is used by conducting a full traffic counting directly in the field that covers the whole movement in a predetermined cordon, either incoming or outgoing. It is expected to know the number of vehicles that do not move (parking) in the region. Afterwards, the need for parking facilities in the region can be identified.

## **2.8 Effects Of Parking .**

Parking has some ill-effects like congestion, accidents, pollution, obstruction to fire-fighting operations etc.

- a. Congestion: Parking takes considerable street space leading to the lowering of

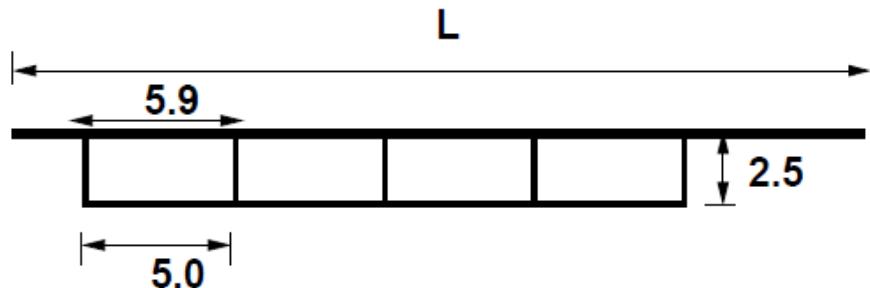

- b. subsequently increase. The operational cost of the vehicle increases leading to great economical loss to the community.
- c. Accidents: Careless maneuvering of parking and unparking leads to accidents which are referred to as parking accidents. Common type of parking accidents occur while driving out a car from the parking area, careless opening of the doors of parked cars, and while bringing in the vehicle to the parking lot for parking.
- d. Environmental pollution: They also cause pollution to the environment because stopping and starting of vehicles while parking and unparking results in noise and fumes. They also affect the aesthetic beauty of the buildings because cars parked at every available space creates a feeling that building rises from a plinth of cars.
- e. Obstruction to fire-fighting operations: Parked vehicles may obstruct the movement of fire-fighting vehicles. Sometimes they block access to hydrants and access to buildings.

## **2.9 Parking Requirements .**

There are some minimum parking requirements for different types of building. For residential plot area less than 300 sq.m require only community parking space. For residential plot area from 500 to 1000 sq.m, minimum one-fourth of the open area should be reserved for parking. may require at least one space for every 70 sq.m as parking area. One parking space is enough for 10 seats in a restaurant where as theatres and cinema halls need to keep only 1 parking space for 20 seats. Thus, the parking requirements are different for different land use zones.

## **2.10 On Street Parking .**

On street parking means the vehicles are parked on the sides of the street itself. This will be usually controlled by government agencies itself. Common types of on-street parking are as listed below. This classification is based on the angle in which the vehicles are parked with respect to the road alignment. As per IRC the standard dimensions of a car is taken as 5, 2.5 meters and that for a truck is 3.75, 7.5 meters.

**Figure 2-2: Illustration Of Parallel Parking**

Parallel parking: The vehicles are parked along the length of the road. Here there is no backward movement involved while parking or unparking the vehicle. Hence, it is the most safest parking from the accident perspective. However, it consumes the maximum curb length and therefore only a minimum number of vehicles can be parked for a given kerb length. This method of parking produces least obstruction to the on-going traffic on the road since least road width is used. Parallel parking of cars is shown in Figure( 2-2).

The length available to park N number of vehicles.

$$L = \frac{N}{59} \dots\dots\dots(2-6)$$

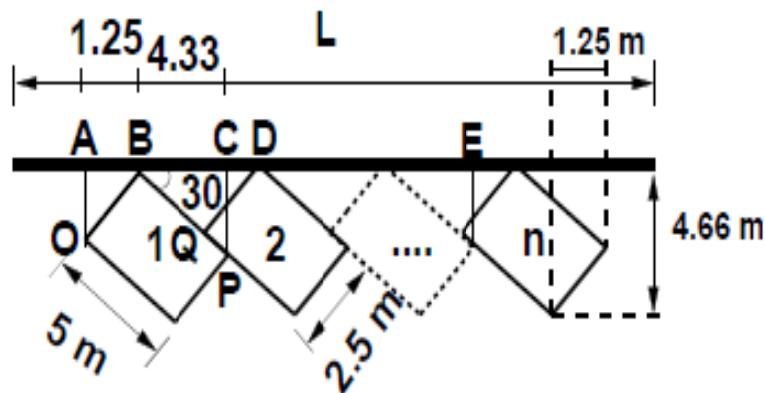

**30° parking:** In thirty degree parking, the vehicles are parked at 30° with respect to the road alignment. In this case, more vehicles can be parked compared to parallel parking. Also there is better maneuverability.

Delay caused to the truck is also minimum in this type of parking. An example is shown in Figure 2-2. From the figure,

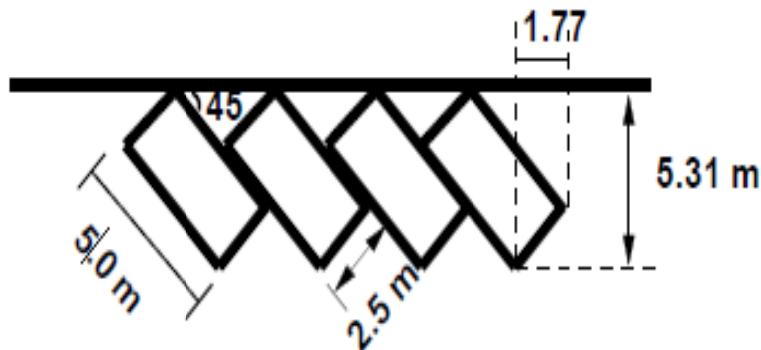

N = —

**45° parking:** As the angle of parking increases, more number of vehicles can be parked. Hence compared to parallel parking and thirty degree parking, more number of vehicles can be accommodated in this type of parking. From figure 2:3, length of parking space available for parking N number of vehicles in a given kerb is :-

N = \_\_\_\_\_

**Figure 2-3: Illustration Of  $30^\circ$  Parking**

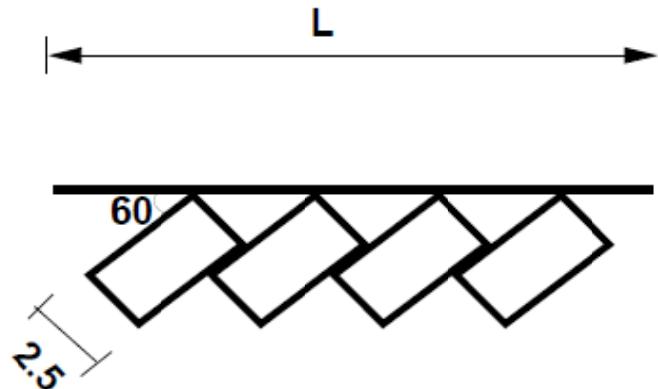

**Figure 2-4: Illustration of  $45^\circ$  parking**

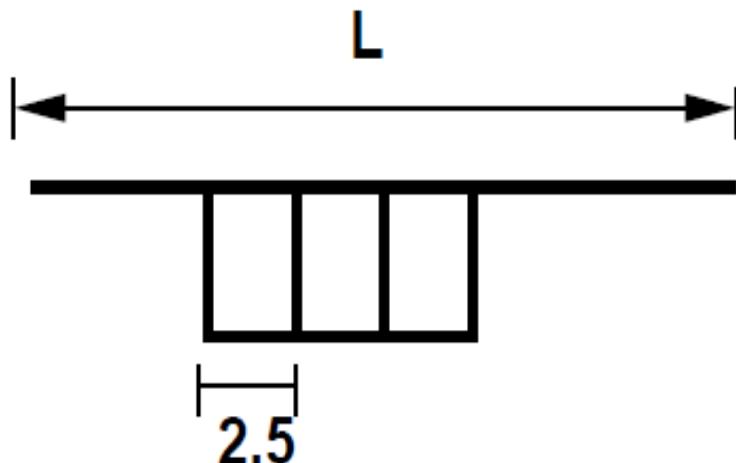

$60^\circ$  parking: The vehicles are parked at  $60^\circ$  to the direction of road. More number of vehicles can be accommodated in this parking type. From the Figure (2- 4), length available for parking N vehicles =  $2.89N+2.16$ .

Right angle parking: In right angle parking or  $90^\circ$  parking, the vehicles are parked perpendicular to the direction of the road. Although it consumes maximum width kerb length required is very little. In this type of parking, the vehicles need complex maneuvering and this may cause severe accidents. This arrangement causes obstruction to the road traffic particularly if the road width is less.

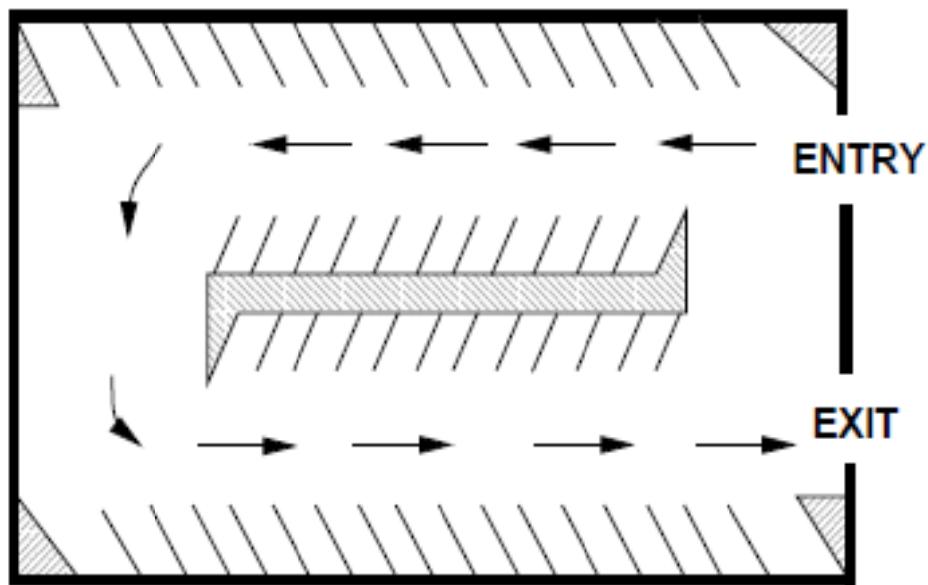

However, it can accommodate maximum number of vehicles for a given kerb length. An example is shown in Figure (2 – 5). Length available for parking N number of vehicles is :-

**Figure 2-5: Illustration of 60° parking**

**Figure 2-6: Illustration of 90° parking**

**Figure 2-7: Illustration of off-street parking**

### **2.11 Off Street Parking .**

In many urban centers, some areas are exclusively allotted for parking which will be at some distance away from the main stream of traffic. Such a parking is referred to as off-street parking. They may be operated by either public agencies or private firms. A typical layout of an off-street parking is shown in figure (2 – 7).

### **2.12 Parking Lot Design .**

#### **2.12.1 General**

The parking lot design objective is to maximize the total number of parking spaces in the space available with the following considerations: The parking layout should provide continuous flow of traffic through the lot. The design should allow safe movement of pedestrians from parking to buildings. The design should allow for appropriate landscaping of the parking areas without conflicting with site lighting.

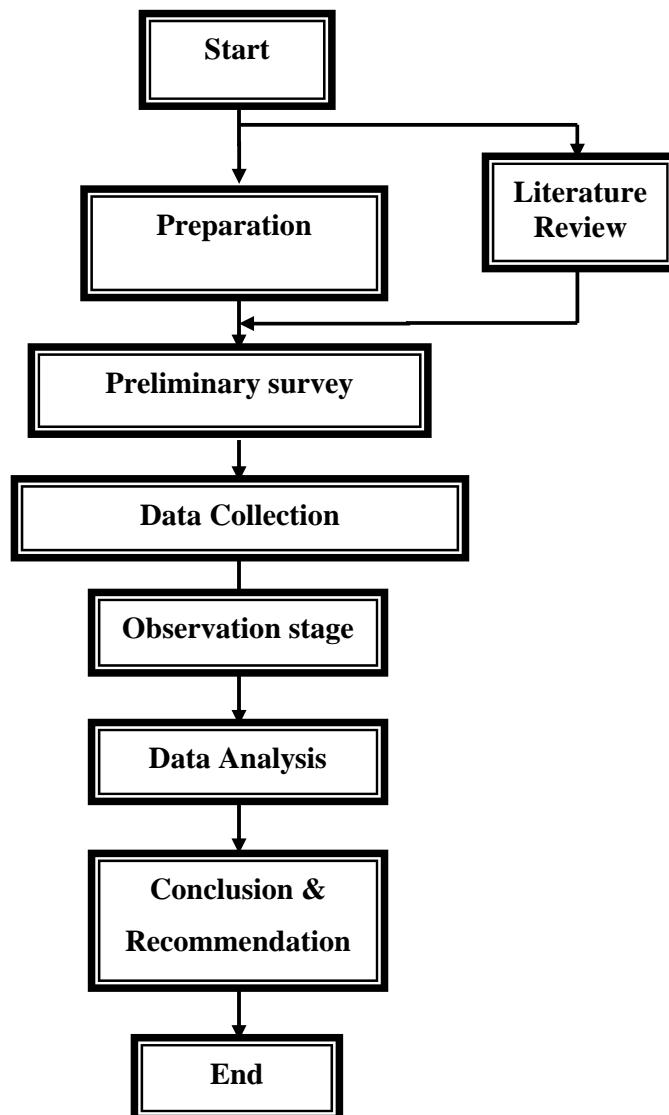

## CHAPTER III

### RESEARCH METHODOLOGY

#### 3.1 Introduction

This chapter discusses the methodology used in this research. The methodology in this research includes research preparation and literature review , data collection ,analysis of the data and conclusion, as shown in the following flow chart . The description of each step is presented in subsequent sections .

**Figure 3.1 Methodology of The Study**

Data needed for the analysis are obtained by performance primary survey at the airport, that is meaning through survey to obtain traffic data of vehicles inside Tripoli International Airport parking by the surveyors, and including it practical and parking is random , although planning Parking is the current as a vertical angle (90 degrees). After the survey is completed within the parking and data collection , we can evaluate the existing parking based on data analysis and conclude the extent we need to redesign the situation.

### **3.2 Types of Data Needed**

What is the overall impact on the passenger terminal as a whole?

To answer all those questions , some primary data is taken by interview to the related authority of the Tripoli international airport ,those are vice president of planning and general manager the guest ion should consist of the following :

- a. Operational activity of the airport .
- b. airport future development planning ,especially of parking lots parking system in the future .

**The secondary data is taken by the official report of Tripoli international airport that consist of data such as**

- a. the number of cars entry and exit in parking .

Data needs in this research include primary data, such as traffic data, and secondary data .

In this study, the material from the primary data is data about the number of vehicular traffic and persons coming from and headed to the airport.

- The number of vehicular traffic .
- Amount of traffic to be involving many vehicles coming to (attracted traffic) and go from (generated traffic) airport per unit time (minutes or hours), vehicle type, occupancy levels, etc.
- Parking of area of Tripoli International Airport is located between the main gate ( entry & exit ) even of the side of road opposite the terminal building and estimated the total parking of area 25,000 square meters approximately.

### **3.3 Parking Data Collection Methods**

There are many methods that can be used to measure time of incoming and outgoing Vehicle Cycles. because it requires large resources. survey process this survey snapped data per vehicle ie vehicle number and the time of entry of the position as well as the time to go out and be over the whole day

### **3.4 Time To Collect Secondary .**

- a. Data is collected secondary traffic passenger vehicles in Sunday because it first work day at week and the weekend days are Friday – Saturday. We start traffic survey at 7 am till even 7 pm through .  
traffic survey for parking existing monitors the number passenger cars entering the parking lot the airport and beyond to prepare spreadsheets for each period quarter of an hour ( per 15 min. ), and it clear to us the number of passenger cars of all times.
- b. We also need to know the number of passengers arriving and departing each month in order to conclude the process of parking arena where it is limited to the number are cars and duration of their stay position during weekdays and holidays.

### **3.5 Parking System At The Tripoli International Airport Is To The Following .**

1. There is existing situation is a major gateway and one way is to cross passenger cars into the parking lot.
2. There are major exit gate and deduction of the financial value of parking fees and we can see how many emerging and remaining within the car park.
3. There is a special position public buses outside the station own parking space at the airport and cause severe congestion and irregular traffic flow as a result of the overlapping of passenger cars with buses.

### **3.6 Supply Data .**

supply data of Tripoli International Airport parking are: -

1. The number of rows of parking position 7 rows and each row accommodate 40 vehicles in addition to grades sides and 120 vehicles bladder However, there are some random vehicles parking .

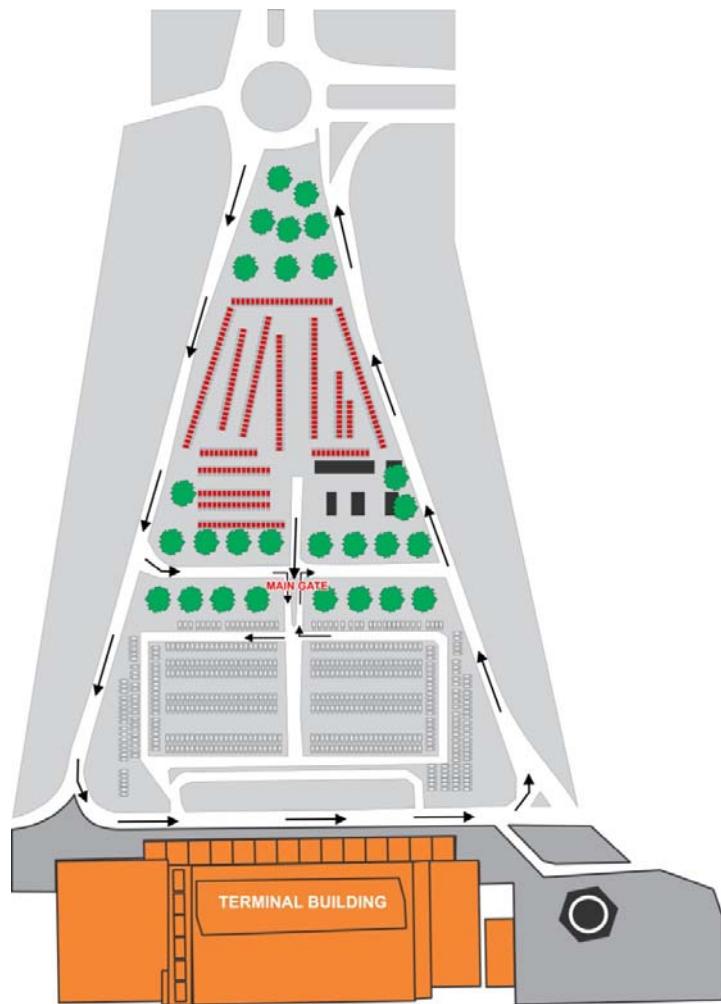

2. Planning is currently available for parking is at a 90-degree angle as shown in Figure (1-6) described previously.
3. Note that there are some vehicles outside the airport parking lot, as shown in Figure (1-6).
4. Based on traffic data field for vehicles within the car park which will we get them in the coming days is to know the desired value of the number of vehicles that exceed the capacity of the car park currently exists and which conclude amplitude required depending on the results of data analysis vehicular traffic within the parking allocated and addition to the number of vehicles which are in the random positions.

## CHAPTER IV

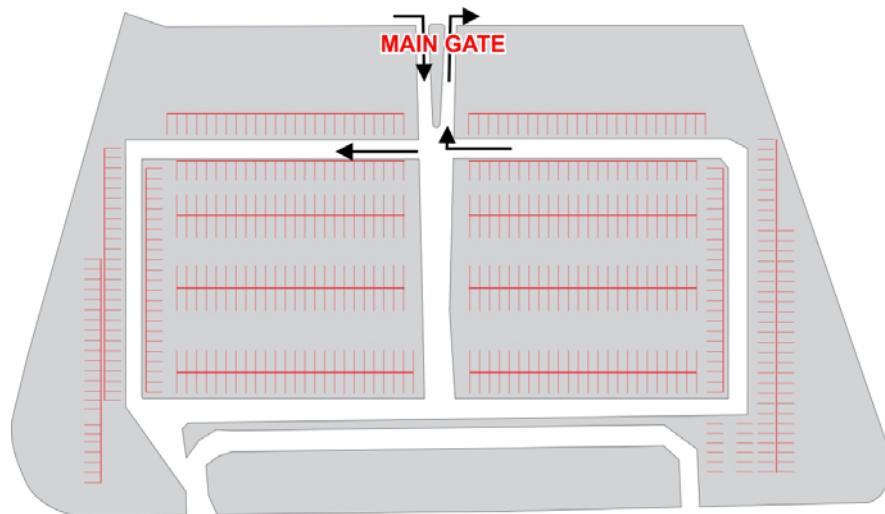

### RESULTS AND ANALYSIS

#### 4.1 Data Collection

Data collected in the field is the traffic data and parking. Traffic data collection using the traffic counting method performed at each entrance and exit of the parking main gate . The capacity of cars parking area is 378 cars .

**Figure 4.1 land use of parking**

**Figure 4.2 Existing parking space**

The survey conducted during one day at 21 of January 2013 for 12 hours Starting from 7:00 am until 7:00 pm , the survey period was divided 48 period to the traffic patterns of parking Tripoli International Airport ,Surveyed by recording the number of cars for one day. The duration of each period of 15 minutes. The result of the survey can be seen on following Table (4-1).

**Table. 4.1 Number of Vehicles Arrived Hourly**

| Arrival Time (h)  | Number of Vehicles |
|-------------------|--------------------|
| 7 : 00 – 7 : 59   | 263                |
| 8 : 00 – 8 : 59   | 217                |
| 9 : 00 – 9: 59    | 297                |
| 10:00 – 10 : 59   | 185                |
| 11 : 00 – 11 : 59 | 123                |
| 12 : 00 – 12 : 59 | 96                 |
| 13 : 00 – 13 : 59 | 255                |
| 14 : 00 – 14 : 59 | 191                |
| 15 : 00 – 15 : 59 | 77                 |
| 16 : 00 – 16 : 59 | 56                 |
| 17 : 00 – 17 : 59 | 94                 |
| 18 : 00 – 18 : 59 | 177                |
| Total             | 2031               |

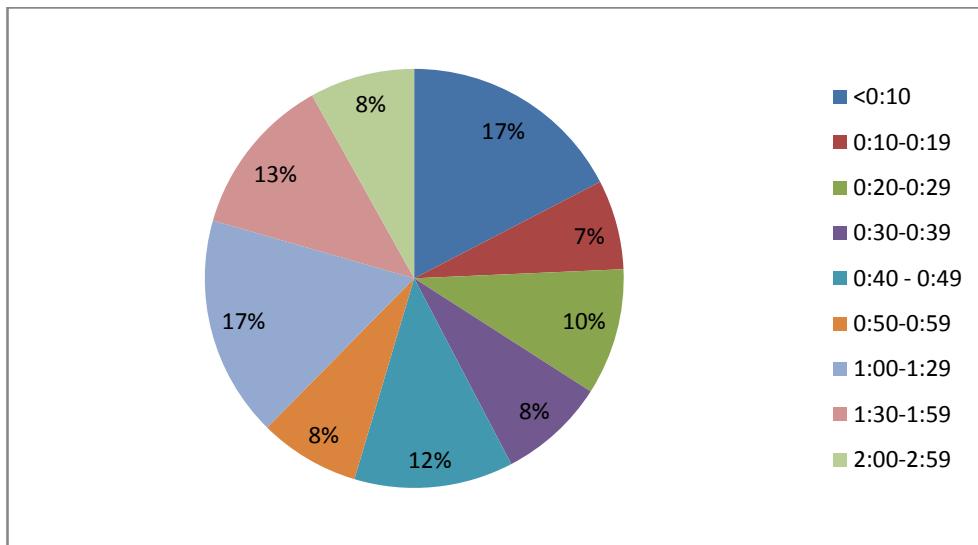

**Table. 4.2 Number of Vehicles Departed Hourly**

| <b>Departed Time (h)</b> | <b>Number of Vehicles</b> |
|--------------------------|---------------------------|
| 7 : 00 – 7 : 59          | 81                        |
| 8 : 00 – 8 : 59          | 142                       |
| 9 : 00 – 9 : 59          | 219                       |
| 10:00 – 10 : 59          | 251                       |
| 11 : 00 – 11 : 59        | 187                       |
| 12 : 00 – 12 : 59        | 121                       |
| 13 : 00 – 13: 59         | 152                       |
| 14 : 00 – 14 : 59        | 210                       |
| 15 : 00 – 15 : 59        | 147                       |
| 16 : 00 – 16 : 59        | 94                        |
| 17 : 00 – 17 : 59        | 66                        |
| 18: 00 – 18 : 59         | 194                       |
| Total                    | 1864                      |

From the table and figure above, it appears that the activities of parking , on the average, has a level of crowded of nearly similar density at almost all of the time of observation since 7:00 am to 10:00 am , except the period of 11:00 am to 1 pm and 2:00 pm to 7:00 pm when it somewhat reduces. According to the vehicle arrival data, it can be said that parking activities is already at the highest level if there are many trips in one time. One characteristic of parked vehicles that should be known is parking duration. To do so, it is necessary to count on the number of vehicles parked for various durations. In this case, the analysis was conducted on 10-minute basis. After 60-minute parking duration, the duration category was increased since the number of parked vehicles decreased by increasing parking duration.

**Table 4.3 the Number of Vehicles Parked based on Each Parking Time**

| <b>Parking Duration ( minutes )</b> | <b>Number of Cars</b> | <b>%</b> |
|-------------------------------------|-----------------------|----------|
| <0:10                               | 324                   | 17%      |
| 0:10-0:19                           | 129                   | 7%       |
| 0:20-0:29                           | 182                   | 10%      |
| 0:30-0:39                           | 154                   | 8%       |
| 0:40 - 0:49                         | 229                   | 12%      |
| 0:50-0:59                           | 145                   | 8%       |
| 1:00-1:29                           | 318                   | 17%      |
| 1:30-1:59                           | 232                   | 13%      |
| 2:00-2:59                           | 151                   | 8%       |
|                                     | 1864                  | 100%     |

**Figure 4.5. Number Parked based on Each Parking Time of Vehicles**

Based on Tables (A-1) attached in appendix note that survey of traffic data collection for Tripoli International Airport parking has start from 7 am to 7 pm where they were 4 surveyors relying on numbers plates of vehicles and also the time of arrival and departure of vehicles for parking and that we have obtained the total of parking time for all vehicles within the park equal to 96,659 minutes during the specified period of the survey, so that value will be get the average of parking time as indicated in the following equation :-

$$AV = \frac{\sum Duration\ time}{N} \quad \dots \dots \dots (4.1)$$

$$AV = \frac{96.659}{1864} = 52 \text{ minutes}$$

Based on the table above, it seems that most visitors have a short visit, as evidenced by the percentage of cars parked less than 10 minutes, and that is equal to 17%. This is apparently because it is already had planned in advance for the survival of the airport arrivals. So most of the cars were parked under the average time, parked approximately 42% of cars less than 40 minutes, the average of parking period 52 minutes unfortunately, some cars parked for a long time.

For example, there is a parked car 38% more than 1 hour .it will contribute to reducing the number of parking spaces for a long time could exceed several days and that is something which causes severe congestion problem and the lack of parking spaces. The following is the table of the accumulation of vehicles parked. To make a simple and clear calculation, the number of vehicles arrived, the number of vehicles departed and the accumulation is presented in 1-hour time period basis.

#### **4.2 Demand of parking**

The demand of parking can be determined by calculating the accumulation of parking time, by using volume cordon studies (Shane and Roess, 1990), given by:.

$$P = A_{i-1} + L_i - O_i$$

In which:

P = the number of demand for parking spaces

$A_{i-1}$  = accumulated in the previous period (vehicles)

$L_i$  = the arrival of vehicles during the period i

$O_i$  = departure of vehicles in the period i, so the calculation it will be as shown in the following:-

$$A_{i-1} = 87$$

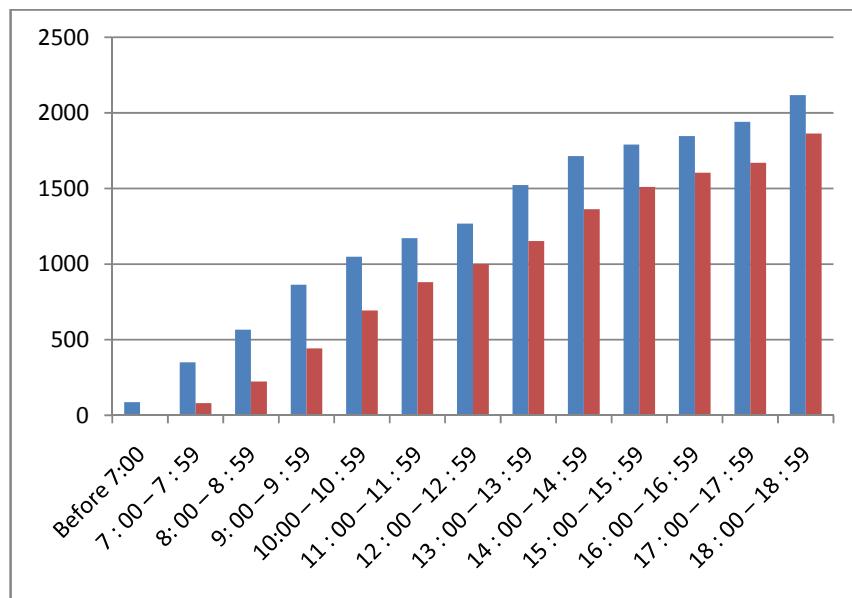

$$L_i = 864$$

$$O_i = 442$$

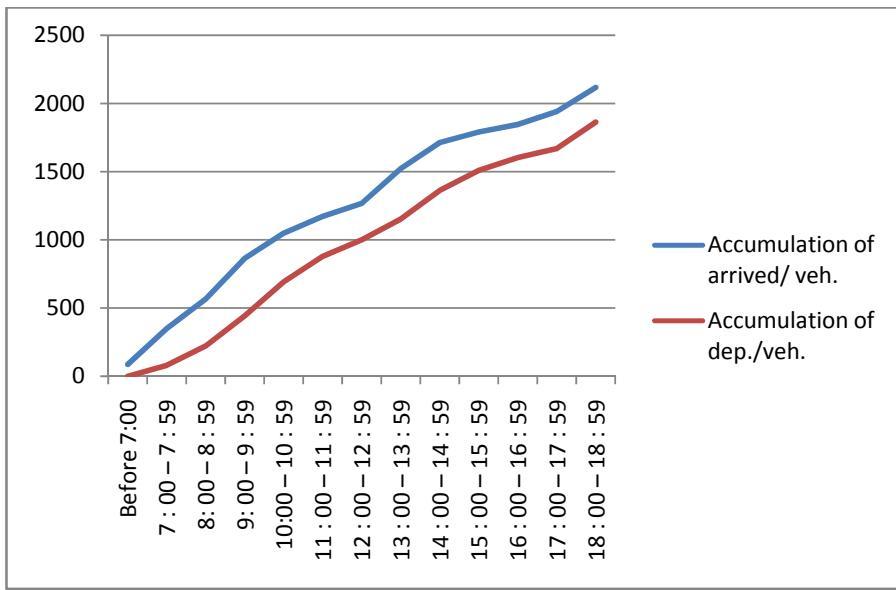

$$P = 87 + 864 - 442 = 509$$

**Table 4.4. The Accumulation of Vehicles Parked**

| Time Period       | Number of Vehicle Arrived | Accumulation of arrived/ veh.<br>Li | Number of Vehicle Departured | Accumulation of dep./veh.<br>Oi | Accumulation |
|-------------------|---------------------------|-------------------------------------|------------------------------|---------------------------------|--------------|
| Before 7:00       | 87                        | 87                                  | -                            | -                               | -            |
| 7 : 00 – 7 : 59   | 263                       | 350                                 | 81                           | 81                              | 269          |
| 8: 00 – 8 : 59    | 217                       | 567                                 | 142                          | 223                             | 344          |
| 9: 00 – 9 : 59    | 297                       | 864                                 | 219                          | 442                             | 422          |
| 10:00 – 10 : 59   | 185                       | 1049                                | 251                          | 693                             | 356          |
| 11 : 00 – 11 : 59 | 123                       | 1172                                | 187                          | 880                             | 292          |
| 12 : 00 – 12 : 59 | 96                        | 1268                                | 121                          | 1001                            | 267          |
| 13 : 00 – 13 : 59 | 255                       | 1523                                | 152                          | 1153                            | 370          |
| 14 : 00 – 14 : 59 | 191                       | 1714                                | 210                          | 1363                            | 351          |
| 15 : 00 – 15 : 59 | 77                        | 1791                                | 147                          | 1510                            | 281          |
| 16 : 00 – 16 : 59 | 56                        | 1847                                | 94                           | 1604                            | 243          |
| 17 : 00 – 17 : 59 | 94                        | 1941                                | 66                           | 1670                            | 271          |
| 18 : 00 – 18 : 59 | 177                       | 2118                                | 194                          | 1864                            | 254          |

**Figure 4.6 Accumulation of arrived & departure vehicle**

**Figure 4.7. The Line Graph of the Accumulation of Vehicles Parked**

### 4.3 Use of Another Parking System

As mentioned in chapter 2, there are several parking system that can be selected, and then by using Litman formula, it can be calculated the number of parking space of each parking types to evaluate its suitability against the parking demand of airport.

Use ( L ) the total of curb length for this equation it will be obtain from existing parking , so it is equal 1254 m .

- a.  $30^0$ -Angular Parking System

In this system, the number of parking space is:

$$N = \frac{L-1,25}{3,41}$$

$$N = \frac{1254-1,25}{3,41} = 367 \text{ lot}$$

- b.  $45^0$ -Angular parking system

In this system, the number of parking space is:

$$N = \frac{L-1,77}{3,54}$$

$$N = \frac{1254-1,77}{3,54} = 354 \text{ lot}$$

- c.  $60^0$ -Angular parking system

In this system, the number of parking space is:

$$N = \frac{L-2,16}{2,89}$$

$$N = \frac{1254 - 2,16}{2.89} = 433 \text{ lot}$$

d.  $90^0$ -Angular parking system

In this system, the number of parking space is:

$$N = \frac{L}{2.50}$$

$$N = \frac{1254}{2.50} = 502 \text{ lot}$$

#### 4.4 Creating Rules of Parking Time Allowed

According to Table 4.3, the average parking time is 52 minutes. However, there were 38 % vehicles parked more than 1 hour. This certainly will decrease the number of parking spaces. Therefore, to give sufficient number of parking spaces and to anticipate of increasingly parking activities, it is proposed to create a better rule of parking time allowed. So that, if the average parking time reduces, the maximum accumulation of vehicles parked is expected to reduce.

The optimal parking capacity can be calculated by using the following equation.

A = Cumulative parking activity on one day (12 hours)

B = Optimal parking capacity

$$B = \frac{\text{Activity time}}{\text{average duration time}} * \text{Number of parking spaces}$$

A - Optimal parking capacity for  $30^0$ -angular parking system:

Activity time = 12 hour

Average duration time = 52 min.

Number of parking space = 245

$$B = \frac{12}{52/60} * 245 = 3393$$

The optimal parking capacity is more than cumulative parking activities in one day, therefore, this parking system is recommended.

B - Optimal parking capacity for  $45^0$ -angular parking system:

Activity time = 12 hour

Average duration time = 52 min.

Number of parking space = 354

$$B = \frac{12}{52/60} * 354 = 4901$$

C - Optimal parking capacity for  $60^\circ$ -angular parking system:

Activity time = 12 hour

Average duration time = 52 min.

Number of parking space = 426

$$B = \text{——} * 426 = 5899$$

D - Optimal parking capacity for  $90^\circ$ -angular parking system:

Activity time = 12 hour

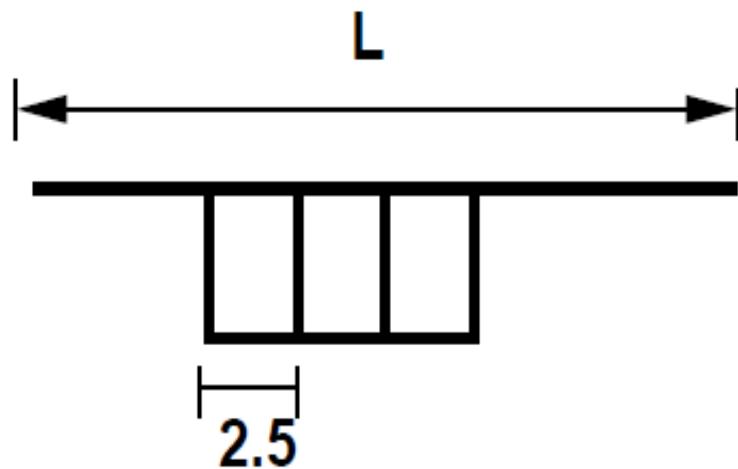

Average duration time = 52 min.

Number of parking space = 502

$$B = \text{——} * 502 = 6951$$

The optimal parking capacity is 6924, it is more than cumulative parking activities incoming in one day 2118 and therefore, this parking system is recommended.

The following figure shows the optimal parking layout for  $90^\circ$ -angular parking system.

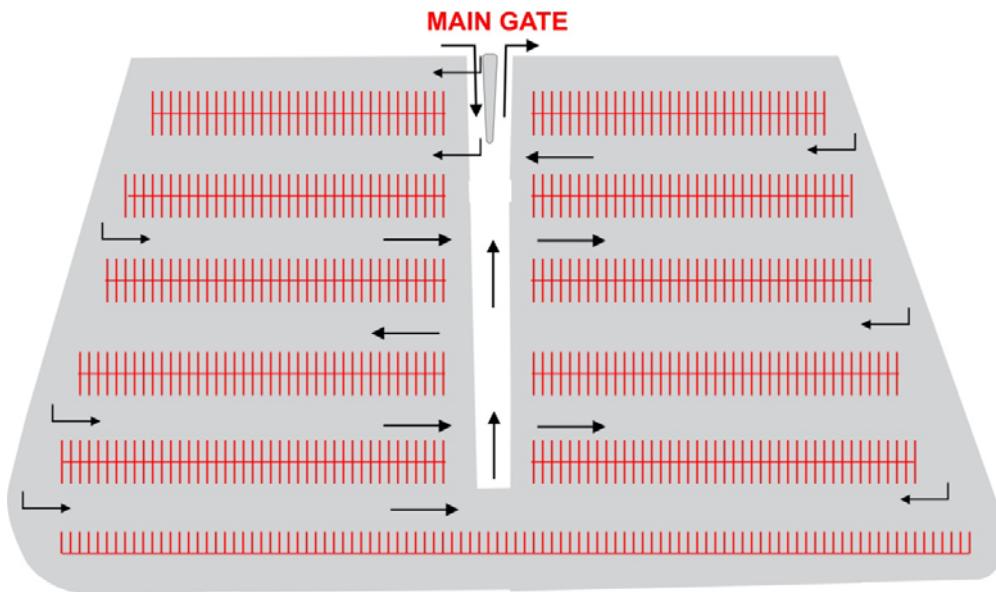

**Figure 4.8 Optimal Parking Layout for  $90^\circ$ -angular Parking System**

It can be said clearly that among these three parking systems, parking system,  $90^\circ$ -angular able to provide more lots for the parking demand .

Conclude from the foregoing traffic data analysis of vehicular within the Tripoli International Airport parking and after comparison the results and obtained, find the demand number of parking space which is equal 509 lots and after used to the four methods for different parking system angular  $30^\circ$ ,  $45^\circ$ ,  $60^\circ$ ,  $90^\circ$ , through analysis of the data for number of parking space found the largest number of parking spaces system is achieved by using a  $90^\circ$  which is same the existing planning now.

Main problem it does not provide the demand number parking space but the problem is the lack of coordination and organization vehicles and parked properly in places allocated to them as shown in Figure 1-6 at chapter I in the problem statement paragraph and therefore we can say that problem is the problem of regulating the conduct Parking meaning attributed the problem to basic mismanagement over the car park and also the behavior of driving where they are parking indiscriminately incorrectly and this is something that requires a review of the management process position passenger terminal and also to redesign the terminal building parking have to re-planned angle of  $90^\circ$  in order to provide a larger number of parking space thus increase the capacity of the current terminal building parking , but make planning based on completion of a new terminal buildings on sides .

**Figure 4.9 New parking design**

## CHAPTER V

### CONCLUSIONS AND RECOMMENDATIONS

#### **5.1 Conclusions**

Proposal of this study is a redesign of parking Tripoli International Airport, and evaluation the performance In the existing parking  $90^\circ$  as shown in chapter I cause of this problem , Of the problem statement that is causing the lack of capacity for terminal parking and also there is no place dedicated to public transport .

so we've compiled all the data and required details for analysis and through the data collected from number of vehicles within parked, we have to conduct the survey as described in data tables provide in (A-1), it can observe the peak hour time at morning (9:00-10:00) as shown in chart for arrival time, so the analysis of this data by using equations previously described chapter II where the data were analyzed and getting calculating the optimum capacity of the parking regulations.

There are many parking systems to apply and get the optimum capacity of parking, these systems are represent as:-

1.  $30^\circ$  angular parking system.
2.  $45^\circ$  angular parking system.
3.  $60^\circ$  angular parking system.

The number of parking space for all these systems as explained in chapter IV, We conclude from analysis of the data and the calculation and the number of spaces Parking system find  $90^\circ$ angular provides 502 lots.

That is mean largest number of parking spaces must be use where, to calculate the optimum capacity for this value to number of parking space .It is noted that the parking demand and the number of parking spaces differ only slightly, and the average parking time is short enough at 52 minutes. If for one reason or another, the number of vehicles arrived or the average of vehicles parking time increase, this situation can also increase the parking demand.

When determine the average of parking time (52 min.) at whole survey day. The maximum value of parking capacity taken in  $90^\circ$ angular parking system 6924.

## **5.2 Recommendations**

After previous conclusions and see the results of data analysis, where it was a peak hour start from (9 am to 10 am) which is cause of the congestion in Tripoli international airport parking and irregular parking system, found insufficient of parking capacity during this period which need to solve this problem so recommend to re-design Parking Tripoli International Airport to provide all facilities necessary needed of parking and must make special parking for public transport also places allocated for people with special needs and need to increase the capacity of terminal parking meet the needs of the delegates to the airport as well as taking into account the new terminals, which is under construction now.

Further increase the parking capacity, in anticipation of the increasing number of vehicles to be parked in the future. This change will increase the number of parking spaces for more vehicles than the current parking demand.

New rules of parking which charge a significant additional parking when a vehicle is parked longer than 1 hour should be implemented. If the average parking time can be reduced, the maximum accumulation of vehicles parked will also be reduced to improve traffic further.

Has collected the data by using four persons and supervisor engineer in charge of the collection of traffic data vehicles saluting the two persons collecting the data as number of cars and plate number at the main gate (entry and exit) also completed the survey of traffic data and organize parking inside position the other two persons and the control engineer in charge of the airport authority.

Depending on the results of data collection are described in the accompanying tables below these data are analyzed according to the method of analysis used it this Tables (4.1,4.66) Car survey .
