FAKTOR HOST, KONSUMSI LEMAK, KONSUMSI KALSIMUM DAN KEJADIAN HIPERTENSI PADA KEHAMILAN

Anindita Az Zahra Lutfiatunnisa, Anita Nugrahaeni, Sri Yuliawati, Dwi Sutningsih

Abstract

Pregnancy induced hypertension is an increase of blood pressure until $\geq 140/90$ mmHg after 20 weeks of gestation among women who are previously normotensive. In the region of Gatak Community Health Center, in 2013 there were 47 cases of pregnancy induced hypertension which could lead to pre eclampsia and maternal and infant mortality. The objective of this study is to analyze the relationship between host factors, fat consumption and calcium consumption with pregnancy induced hypertension. This was an observational analytic with cross sectional study design. The subjects were 78 pregnant women in the region of Gatak Community Health Center using purposive sampling technique. Bivariate analysis performed using chi square. Bivariate analysis showed association between the level of knowledge ($p=0.002$; POR 4.91; 95%CI 1.69-14.27), history of hypertension ($p=0.023$; POR 3.75; 95%CI 2.58-5.46), nutritional status before pregnancy ($p=0.004$; POR 6.8; 95%CI 1.79-25.74), weight gain during pregnancy ($p=0.006$; POR 7.58; 95%CI 1.75-32.78), consumption of fat ($p=0.003$; POR 6.43; 95%CI 1.71- 24.15), and calcium intake ($p=0.014$; POR 3.91; 95% CI 1.38-11.05) with pregnancy induced hypertension. A pregnant women should have normal nutritional status before pregnancy, normal weight gain during pregnancy, decrease consumption of fat and increase calcium intake to prevent

pregnancy induced hypertension.
